Participate in a study aimed at exploring how your brain processes the language of emotion!

Who is invited?
We are interested in individuals between the ages of 15 & 30 who are typically developing or who have been diagnosed with autism or Asperger’s syndrome.

What to expect:
We are screening interested individuals to determine if they meet eligibility criteria for the study. If you qualify, there are two types of testing: standard pencil & paper assessments and a brain scan. The assessments are done independently or with a researcher, and may last up to 3 hours. During the fMRI scan participants will read/listen to sounds/words/sentences or view pictures while making judgments. The scan lasts about 1 ½ hours. The testing may be done in one or two sessions, and volunteers will receive monetary compensation for their time. Weekday or Saturday testing is available.
